1) Username and password
2)

3) The code was having verification issues with Username and password because it was depending on the user's retyping information so the variable would save the new value, now it autogenerates the user name base on other components like the user's birthday, and the user doesn't need to retype it, also the password now uses one of those components (phone number)

4)
    a. Two factors authentication: High Priority
    b. Wrong input not equal to breaking !!!! : High Priority
    c. More User Friendly : Medium Priority
    d. Exit plan for user to leave at any second : medium
